Apporthetical protein K10G6.3 - Caenorhabditis elegans
C;Species: Caenorhabditis elegans
C;Species: Oct-1999 #sequence_revision 29-Oct-1999 #text_change 29-Oct
C;Accession: T32008
R;Davidson, S; Wohldmann, P.; Mullen, G.
submitted to the EMBL Data Library, July 1997
A;Description: The sequence of C. elegans cosmid K10G6.
A;Reference number: Z21111
A;Accession: T32008
A;Accession: T32008
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: DNA
A;Residues: 1-1819 < DAV>
A;Cross-references: EMBL:AF016669; PIDN:AAB66098.1; GSPDB:GN00020; CESF

Cancer Inst. 91:594-598(1999).
DISEASE: MAPS TO A CHROMOSOME REGION FREQUENTLY MUTATED IN DIVERSE CELL LINES OF HUMAN CANCER. APPEARS NOT TO BE FREQUENTLY MUTATED IN HUMAN CANCERS, IN CONTRAST TO P53. HEMIZYGOSITY IS OBSERVED IN NEUROBLASTOMA AND OLICODENDROGLIOMA.
SIMILARITY: BELONGS TO THE P53 FAMILY.
                                                                                                         TISSUE SPECIFICITY: BRAIN, KIDNEY, PLACENTA, COLON, SPLEEN, SKELETAL MUSCLE, PROSTATE, THYMUS AND PANCE INDUCTION: NOT INDUCED BY DAMAGE.

DOMAIN: POSSESSES AN ACIDIC TRANSACTIVATION DOMAIN, BINDING DOMAIN AND A C-TERMINAL OLIGOMERIZATION DON TO THE ABL TYROSINE KINASE SH3 DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBUNIT: THE C-TERMINAL OLIGOMERIZATION DOMAIN BINDS TO THE TYROSINE KINASE SH3 DOMAIN. ISOFORM BETA INTERACTS HOMOTYPIC AND WITH P53, WHEREAS ISOFORM ALPHA DOES NOT. ISOFORM GAMMA INTERACTS HOMOTYPICALLY AND WITH ALL P73 ISOFORMS. ISOFORM D INTERACTS WITH ISOFORM GAMMA, ALPHA, AND HOMOTYPICALLY.

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BAX and FAS antigen expression, or by repression of Bcl-2

-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.

Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                              Apoptosis induction

                                                                                                                                                                                                                     FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of

                                                                                                                                                                                                                                                                                    Local Sin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression (By similarity).
SUBUNIT: Binds DNA as a homotetramer (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                          growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2 expression (By similarity)

Involved in cell cycle regulation a trans-activator that acts to negatively regulate cell divisior by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation o BAX and FAS antigen expression, or by repression of BCl-2
                                                                                                                                                                                                                                                                                                                                                                                                            European Bioinformatics Institute.                      FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved the capture of cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.

Submitted (APR-1997) to the EMBL/GenBank/DDBJ databases.

-I-FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAS antigen expression, or by repression of Bcl-2

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                            BAX and FAS antigen expression, or by repression

                                                                                                                                                                                                                                                                                         Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BC1-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in many types of cancer. SIMILARITY: BELONGS TO THE P53 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expression.

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mammalia; Eutheria;
                                                                       in many types of cancer.
SIMILARITY: BELONGS TO THE P53
                                                                                           SUBUNIT: Binds DNA as a homotetramer SUBCELLULAR LOCATION: Nuclear. DISEASE: p53 is found in increased am of transformed cells. p53 is frequent in many types of cancer.
                                                                                                                                                                                                                                growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                 expression
                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Acts as a tumor suppressor

C. -!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES; INDUCES C GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CELL CYCLE REGULATION AS A TEAMS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES: REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES. C APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2 EXPRESSION (BY SIMILARITY).

C -!- SUBGUNIT: BINDS DNA AS A HOMOTETRAMER (BY SIMILARITY).

C -!- SUBGULLUAR LOCATION: NUCLEAR (BY SIMILARITY).

C -!- SUBGULLUAR LOCATION: NUCLEAR (BY SIMILARITY).

C -!- SUBGULLUAR LOCATION: NUCLEAR (BY SIMILARITY).

C -!- SIMILARITY: BELONGS TO THE PS3 FAMILY.

DR MANY TYPES OF CANCER (BY SIMILARITY).

C -!- SIMILARITY: BELONGS TO THE P53 FAMILY.

DR MANY TYPES OF CANCER (BY SIMILARITY).

EXPRESSION (BY SIMILARITY).

SUBUNIT: BINDS DNA AS A HOMOTETRAMER (BY SIMILARITY).

SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN I
TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OF
MANY TYPES OF CANCER (BY SIMILARITY).

SIMILARITY: BELONGS TO THE P53 FAMILY.

SIMILARITY: AC62642.1; -.

SP; P04637; 1YCS.
                                                                                                        FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES; INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTANCES AND CELL TYPE. INVOLVED IN CELL CYCLE REGULATION AS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES. APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  375

Neoplasia 1:71-79(1999).

CIPCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES; INDUCES GROWTH ARREST OR APOPTOGIS DEPENDING ON THE PHYSIOLOGICAL GROWTH ARREST OR APOPTOGIS DEPENDING ON THE PHYSIOLOGICAL GROWTH ARREST OR APOPTOGIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTRANCES AND CELL TYPE. INVOLVED IN CELL CYCLE REGULATION AS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE ORD OF THE ACTIVATED GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

CHAPPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2 EXPRESSION (BY SIMILARITY).
